

Diagnostic Question Framework

What we evaluate and how we score it

This framework outlines the questions Fill System uses during a Business & IT Diagnostic engagement. Each section targets a specific operational domain, and responses are scored on a 1-5 maturity scale to identify gaps, risks, and improvement opportunities.

Diagnostic questions

1 Process & workflow

10 questions

We assess how work moves through the organization - from lead generation to revenue collection. Well-documented, consistently executed processes are the foundation of scalable operations.

01 How are leads handed off from marketing to sales?

Looking for: documented SLA, defined MQL/SQL criteria, automated routing

02 Who owns each stage of the customer journey, from first touch to renewal?

Looking for: RACI clarity, no ownership gaps between stages

03 What happens when a deal stalls in the pipeline for more than 14 days?

Looking for: escalation process, automated alerts, win-back workflows

04 How is a new client onboarded after contract signature?

Looking for: documented checklist, timeline, assigned responsibilities

05 Where are your core business processes documented, and when were they last updated?

Looking for: centralized documentation, regular review cadence

06 How many steps in your quote-to-cash process require manual intervention?

Looking for: automation opportunities, bottleneck identification

07 What is the average time from qualified lead to closed deal?

Looking for: benchmarkable metric, stage-level breakdown available

08 How do you handle exceptions or edge cases in standard workflows?

Looking for: defined escalation paths, exception documentation

09 How does information flow between departments when a project changes scope?

Looking for: change management process, notification chain

10 What percentage of your team could describe the end-to-end revenue process?

Looking for: organizational process literacy, training practices

2 Systems & tools

8 questions

We evaluate the technology stack for fitness, integration quality, and utilization. The goal is not more tools, but better-connected, fully-utilized tools.

01 Which systems hold customer data, and how many contain overlapping records?

Looking for: single source of truth, data duplication extent

02 How many tools require manual data transfer between them?

Looking for: integration gaps, manual sync burden

03 What percentage of your CRM's features does your team actively use?

Looking for: utilization rate, training gaps, feature awareness

04 How are new tools evaluated, approved, and rolled out to the team?

Looking for: governance process, shadow IT risk

05 When was the last time you audited your software subscriptions for redundancy?

Looking for: spend awareness, consolidation opportunities

06 How do your systems handle a contact who appears in multiple roles or companies?

Looking for: deduplication strategy, data model flexibility

07 What integrations exist between your CRM, marketing platform, and financial systems?

Looking for: integration architecture, data flow mapping

08 If your primary CRM went down for 24 hours, what would your team use as a fallback?

Looking for: business continuity planning, system dependency awareness

3 Data & reporting

6 questions

We assess whether leadership has access to accurate, timely data for decision-making. Poor data quality and manual reporting are among the most common - and most costly - operational inefficiencies.

01 How is pipeline and revenue data reported to leadership, and how often?

Looking for: reporting cadence, automation level, data freshness

02 How many different definitions exist across teams for the same KPI (e.g., "qualified lead", "active customer")?

Looking for: metric alignment, shared data dictionary

03 How long does it take to answer the question "How much revenue did we close last month?"

Looking for: data accessibility, report generation time

04 What is your pipeline forecast accuracy over the past four quarters?

Looking for: forecast reliability, calibration practices

05 How many spreadsheets are actively used for tracking data that also exists in a system of record?

Looking for: shadow data, system trust issues

06 Who is responsible for data quality, and how are data issues identified and resolved?

Looking for: data governance ownership, error correction process

4 Risk & security

6 questions

We identify operational risks that could disrupt the business - from key-person dependencies to access control gaps. These risks are often invisible until they materialize.

01 Who has admin access to your CRM, and when was the access list last reviewed?

Looking for: access control hygiene, principle of least privilege

02 What happens to active deals and client relationships if a key salesperson leaves?

Looking for: knowledge transfer process, relationship continuity plan

03 How many critical processes depend on a single person's knowledge?

Looking for: key-person risk, documentation coverage

04 What is your data backup and recovery process for customer and financial records?

Looking for: backup frequency, recovery time objective, tested restores

05 How do you ensure client data is handled in compliance with privacy regulations?

Looking for: compliance awareness, data handling policies

06 What would the business impact be if your email system was unavailable for 48 hours?

Looking for: communication dependency, alternative channels

5 Automation & AI readiness

5 questions

We evaluate where automation and AI can deliver the highest impact. Effective automation requires clean processes and data first - technology amplifies what already exists, for better or worse.

01 Which manual tasks are performed more than 10 times per week by any team member?

Looking for: high-frequency automation candidates, time-cost analysis

02 How much time does your team spend on data entry, copy-pasting, or reformatting information?

Looking for: manual data handling burden, integration opportunities

03 Have you implemented any workflow automations in the past 12 months? What was the result?

Looking for: automation maturity, past successes/failures, internal capability

04 Where do you see the biggest opportunity for AI or automation in your operations?

Looking for: leadership vision, alignment with actual bottlenecks

05 What data would you need to make decisions faster, if it were available in real time?

Looking for: decision support gaps, dashboard/alert opportunities

Scoring guide

Each diagnostic area is scored on a 1-5 maturity scale. Scores are assigned based on the combined evidence from question responses, system audits, and process observation. The overall diagnostic score is the weighted average across all five areas.

1 AD HOC No documented process. Work depends on individual knowledge. Outcomes are unpredictable.	2 REACTIVE Some awareness of gaps. Processes exist informally. Problems are fixed after they occur.	3 DEFINED Processes are documented and assigned. Execution is mostly consistent. Basic metrics exist.	4 MANAGED Processes are measured and improved. Automation handles routine work. Data drives decisions.	5 OPTIMIZED Continuous improvement culture. Predictive insights. Industry-leading efficiency.
--	--	--	---	--

Area weights

Area	Weight	Rationale
Process & Workflow	30%	Foundation for everything else. Process gaps cascade into every other area.
Systems & Tools	20%	Enablers of process execution. Poor tools create friction; unused tools waste budget.
Data & Reporting	20%	Quality of decision-making depends on quality of information.
Risk & Security	15%	Low-probability, high-impact events that can derail operations.
Automation & AI	15%	Efficiency multiplier. Only effective when built on clean processes and data.

Priority matrix template

Use this template to map diagnostic findings by Impact (vertical axis) and Effort (horizontal axis). Items in the top-left quadrant (high impact, low effort) should be addressed first. Items in the bottom-right quadrant (low impact, high effort) should be deprioritized or deferred.

Reading the matrix

Zone	Color	Action
Do first (top-left)	Red	High impact, low effort. Quick wins that build momentum.
Plan next (top-right / middle)	Yellow	Significant impact but requires more resources or planning.
Defer or delegate (bottom-right)	Green	Lower priority. Address after higher-impact items are resolved.

How to use this template: After completing the diagnostic, write each finding on a sticky note (or in the corresponding cell). Discuss placement with stakeholders to build alignment on priorities. The matrix is a conversation tool, not a rigid formula - context and organizational readiness matter as much as the scores.
