

Business & IT Diagnostic Report

Process, Systems & Operations Assessment

Prepared for: [Company Name Redacted]

Industry: B2B Professional Services

Date: [Redacted]

Prepared by: Fill System Diagnostic Team

CONFIDENTIAL

Executive summary

Fill System conducted a comprehensive diagnostic of the client's business operations, systems infrastructure, and internal processes over a two-week engagement. The client is a B2B professional services firm with approximately 100 employees across three offices, using HubSpot CRM as their primary customer management platform alongside a mix of spreadsheets, email-based workflows, and manual handoff procedures.

Our assessment identified significant operational friction in the lead-to-revenue pipeline, with an estimated \$180K-\$240K in annual revenue at risk due to undocumented handoff points, inconsistent data entry practices, and reporting gaps that prevent leadership from making timely, data-informed decisions. The sales team currently spends approximately 8-12 hours per week on manual data reconciliation between HubSpot and their invoicing system, time that could be redirected to revenue-generating activities.

The good news: the client's technology stack is fundamentally sound. HubSpot is well-suited for their scale and complexity, and the team demonstrates strong domain expertise. The primary issues are process-oriented rather than technology-oriented, meaning improvements can be made without major system replacements. We recommend a phased 90-day remediation plan focused first on documenting and standardizing the four critical handoff points, then automating the most time-intensive manual processes, and finally establishing a reporting cadence that gives leadership real-time pipeline visibility.

Overall diagnostic score: 2.4 / 5.0 - The organization has strong foundations but significant process gaps that create compounding inefficiencies. Immediate attention to handoff documentation and data hygiene will yield the fastest ROI.

Process map summary

We evaluated six core business processes across the organization, assessing each for documentation quality, consistency of execution, tool utilization, and measurable outcomes. The table below summarizes our findings.

Process	Owner	Status	Key finding
Lead handoff (Marketing to Sales)	VP Marketing / Sales Director	RED	No formal SLA or handoff criteria. MQLs defined differently by marketing and sales. 23% of leads fall through without follow-up.
Deal progression	Sales Director	YELLOW	Pipeline stages exist in HubSpot but advancement criteria are informal. 3 of 7 stages have no exit requirements documented.
Client onboarding	Account Management	YELLOW	Onboarding checklist exists but is maintained in a personal spreadsheet. Varies significantly by account manager.
Pipeline & revenue reporting	RevOps / Finance	RED	Leadership receives weekly report built manually from 3 sources. Report takes 4+ hours to compile; data is 2-3 days stale by delivery.
Invoicing & collections	Finance	YELLOW	Manual data transfer from HubSpot to QuickBooks. Occasional discrepancies in deal amounts; average DSO is 52 days (industry benchmark: 35).
Internal knowledge sharing	None assigned	GREEN	Confluence is well-maintained for product documentation. Gap exists for process documentation and SOPs.

Process maturity distribution: 2 processes rated Red (critical gaps), 3 rated Yellow (functional but fragile), 1 rated Green (healthy). No process scored at the highest maturity level, indicating organization-wide opportunity for standardization.

Key findings

Finding 1: Undocumented handoff points between marketing and sales

We identified four distinct points where leads, deals, or customer information passes between teams without a documented process, defined ownership, or system-enforced workflow. These handoff gaps result in 23% of marketing-qualified leads never receiving sales follow-up, and an average 4.2-day delay on the leads that do get contacted.

Estimated impact: \$180K-\$240K annual revenue at risk from lost and delayed leads

Finding 2: Manual reporting consumes 20+ hours per week across the organization

Three separate teams (Sales, Finance, and Account Management) each build their own weekly reports by manually extracting data from HubSpot, cross-referencing with spreadsheets, and formatting for leadership review. These reports frequently contain conflicting numbers because they pull from the same source at different times and apply different filters.

Estimated impact: \$62K annual cost in labor hours + decision risk from inconsistent data

Finding 3: CRM data hygiene degrading pipeline accuracy

42% of deals in HubSpot have at least one critical field missing (close date, deal amount, or deal stage). 18% of contacts have no associated company record. The sales team reports low trust in pipeline forecasts, which has led to a parallel shadow pipeline tracked in spreadsheets by two senior reps.

Estimated impact: Pipeline forecast accuracy currently at 34% (industry benchmark: 65-75%)

Finding 4: Key-person dependency in operations and finance

Two critical business processes (monthly revenue reconciliation and client onboarding configuration) depend entirely on single individuals with no documented procedures or cross-trained backups. Both individuals have been with the company for 5+ years and hold institutional knowledge that exists nowhere in writing.

Estimated impact: 2-4 week operational disruption risk if either person is unavailable

Priority matrix

Each finding was scored on two dimensions: **Impact** (potential business value of resolution, 1-5) and **Effort** (resources and time required, 1-5 where 1 is lowest effort). The Priority Score combines these with a risk-if-ignored multiplier to produce a recommended sequencing.

Finding	Impact	Effort	Risk if ignored	Priority
Undocumented handoff points	5	2	Revenue leakage continues to compound; sales-marketing tension increases	P1 - Critical
Manual reporting burden	4	3	Leadership decisions remain based on stale data; team burnout from repetitive work	P1 - Critical
CRM data hygiene	4	3	Forecast accuracy continues to erode; shadow systems proliferate	P2 - High
Key-person dependency	3	2	Single point of failure for critical processes; unquantifiable risk event	P2 - High

Scoring methodology

Impact (1-5): 1 = Minor inconvenience, 2 = Noticeable inefficiency, 3 = Measurable business cost, 4 = Significant revenue/risk impact, 5 = Critical business threat.

Effort (1-5): 1 = Quick win (days), 2 = Small project (1-2 weeks), 3 = Moderate project (3-6 weeks), 4 = Major initiative (2-3 months), 5 = Transformation program (6+ months).

Priority is determined by Impact-to-Effort ratio weighted by risk severity. High-impact, low-effort items with escalating risk are sequenced first.

Recommended roadmap

Based on our priority matrix, we recommend the following phased approach. Each phase builds on the previous, and early wins are designed to generate organizational momentum and stakeholder buy-in for subsequent phases.

DAYS 1-30: STABILIZE

- Document all four marketing-to-sales handoff points with clear ownership, SLAs, and escalation paths
- Define and align MQL/SQL criteria between marketing and sales leadership
- Implement HubSpot lead routing rules to enforce automated handoff and assignment
- Establish mandatory CRM field requirements for deal creation (close date, amount, stage)
- Begin documenting the two key-person-dependent processes (revenue reconciliation, onboarding config)

DAYS 31-60: AUTOMATE

- Build unified leadership dashboard in HubSpot replacing the three manual weekly reports
- Configure automated pipeline hygiene alerts (stale deals, missing fields, overdue stages)
- Implement HubSpot-to-QuickBooks integration for automated deal-to-invoice data sync
- Complete process documentation and cross-train at least one backup for each critical role
- Establish weekly pipeline review cadence with standardized metrics and definitions

DAYS 61-90: OPTIMIZE

- Refine lead scoring model based on first 60 days of clean handoff data
- Implement deal velocity tracking and stage-specific conversion metrics
- Evaluate automation opportunities for client onboarding (task sequences, template generation)
- Conduct follow-up diagnostic assessment to measure improvement against baseline metrics
- Present ROI analysis to leadership with recommendations for next optimization phase

Expected outcomes at 90 days: 15-20% improvement in lead-to-opportunity conversion, 60%+ reduction in manual reporting hours, pipeline forecast accuracy above 55%, and elimination of single points of failure in critical processes.

Appendix

What was reviewed

- HubSpot CRM configuration, workflows, and data quality (full audit)
- Sales pipeline structure, deal flow, and conversion metrics (12-month historical)
- Marketing-to-sales handoff process (interviews with 8 team members)
- Financial reporting workflow and invoicing process (observation + documentation review)
- Client onboarding process (3 recent onboardings observed)
- Internal documentation and knowledge management systems (Confluence, Google Drive)
- Technology stack inventory and integration map

What was not included in this assessment

- Product or service delivery quality assessment
- Employee satisfaction or organizational culture evaluation
- Cybersecurity or IT infrastructure penetration testing
- Legal or compliance audit (GDPR, SOC 2, etc.)
- Competitive market analysis or pricing strategy review

Methodology

This diagnostic was conducted over a 10-business-day engagement using Fill System's structured assessment framework. Our methodology combines quantitative data analysis (CRM metrics, pipeline data, financial reports) with qualitative research (stakeholder interviews, process observation, documentation review). Each process area is scored on a 1-5 maturity scale across four dimensions: documentation, consistency, tool utilization, and measurable outcomes.

All findings were validated through multiple data points and cross-referenced with at least two stakeholder perspectives before inclusion in this report. Impact estimates are based on industry benchmarks, the client's own financial data, and conservative assumptions documented in our working papers.

About Fill System

Fill System is a diagnostic-first IT and operations consultancy specializing in mid-market B2B companies. We help organizations identify and resolve the process gaps, system misconfigurations, and operational blind spots that silently erode revenue and efficiency. Our approach starts with a comprehensive diagnostic - never with a product pitch - because the right solution depends on understanding the real problem first.
